

Performance Portability of the Chapel Language on Diverse Architectures

ChapelCon '24 7 June 2024

Josh Milthorpe, Xianghao Wang, and Ahmad Azizi

ORNL Advanced Computing Systems Research, <u>milthorpe</u> Australian National University

This research used resources of the Experimental Computing Laboratory (ExCL) at the Oak Ridge National Laboratory, which is supported by the Office of Science of the U.S. Department of Energy under Contract No. DE-AC05-00OR22725.

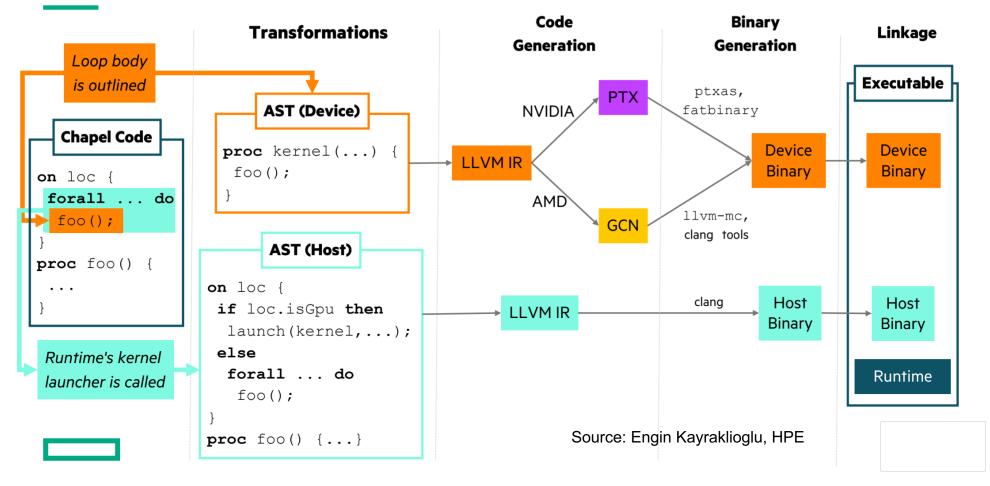

Chapel on Heterogeneous Architectures

Single-source compilation to multiple targets through LLVM

COMPILATION TRAJECTORY

Performance Portability

- Application code should run on many different hardware platforms ...
 - (without requiring rewriting for each new platform)
- ... and achieve acceptable performance on each platform
 - (without platform-specific optimizations)
- \bullet Pennycook, Sewall, and Lee's metric $\mathbf{\Psi}$: harmonic mean of efficiency on each platform
 - Architectural efficiency e.g. fraction of peak FLOP/s
 - Application efficiency e.g. inverse speedup versus fastest version
 - $-\Psi$ = 0 if code doesn't run on all platforms
- How well does Chapel support development of performance-portable application codes compared to more widely-used programming models like OpenMP and Kokkos?

Mini-apps

- We created new Chapel implementations of three mini-apps developed by the University of Bristol's High Performance Computing group
- These miniapps have been used extensively to compare parallel programming models and already have idiomatic implementations in OpenMP, Kokkos, CUDA, and HIP.
 - BabelStream: streaming memory access
 - miniBUDE: numerically intensive molecular dynamics
 - TeaLeaf: memory-intensive stencil PDE solver
- Not included in this study:
 - multi-device
 - distributed memory
 - programmer productivity

BabelStream

 An update of McCalpin's Stream memory bandwidth benchmark, comprising:

Kernel	Function	Load/Store	FLOP
Сору	C = A	2	0
Add	C = A + B	3	1
Mul	$B = \alpha * C$	2	1
Triad	$A = B + \alpha * C$	3	2 (1 FMA)
Nstream (PRK)	$A += B + \alpha * C$	4	3 (1 FMA)
Dot	$x = A \cdot B$	2	2 (1 FMA)

• We measure BabelStream version 5.0 triad with 228 64-bit FP elements

https://github.com/milthorpe/BabelStream

BabelStream Triad Implementations

```
chapel proc triad() {
    forall i in vectorDom do
        A[i] = B[i] + scalar * C[i];
    }
}
```

```
const streamLocale = if useGPU
    then here.gpus[deviceIndex]
    else here;
on streamLocale do {
    const vectorDom = 0..#arraySize;
    var A, B, C: [vectorDom] eltType = noinit;
}
```

- CPU: loop is decomposed into chunks to be executed by worker threads
- GPU: compiled to PTX (NVIDIA) or GCN (AMD) for each threads to compute a triad of elements; compiler generates host-side code for kernel launch and synchronization

```
template <class T>
void CUDAStream<T>::triad()
{
    triad_kernel<<<array_size/TBSIZE, TBSIZE>>>
        (d_a, d_b, d_c);
    check_error();
    cudaDeviceSynchronize();
    check_error();
}
```

```
template <typename T>
   __global__ void triad_kernel(T * a, const T * b,
const T * c)
{
   const T scalar = startScalar;
   const int i = blockDim.x * blockIdx.x +
threadIdx.x;
   a[i] = b[i] + scalar * c[i];
}
```

BabelStream Triad Implementations (2)

Kokkos

```
template <class T>
void KokkosStream<T>::triad()
{
   Kokkos::View<T*> a(*d_a);
   Kokkos::View<T*> b(*d_b);
   Kokkos::View<T*> c(*d_c);

   const T scalar = startScalar;
   Kokkos::parallel_for(array_size, KOKKOS_LAMBDA (const long index)
   {
      a[index] = b[index] + scalar*c[index];
   });
   Kokkos::fence();
}
```

BabelStream Triad Implementations (3)

OpenMP

```
template <class T>
void OMPStream<T>::triad()
  const T scalar = startScalar;
#ifdef OMP TARGET GPU
  int array_size = this->array_size;
 T *a = this->a;
 T *b = this->b;
 T *c = this->c;
  #pragma omp target teams distribute parallel for simd
#else
 #pragma omp parallel for
#endif
  for (int i = 0; i < array size; i++)</pre>
   a[i] = b[i] + scalar * c[i];
 #if defined(OMP_TARGET_GPU) && defined(_CRAYC)
 // If using the Cray compiler, the kernels do not block, so this update forces
  // a small copy to ensure blocking so that timing is correct
  #pragma omp target update from(a[0:0])
  #endif
```

miniBUDE

- Proxy app created from University of Bristol BUDE protein simulator
 - calculates energy of each ligand-protein pair in different poses (position + rotation)
 - highly arithmetically intensive: FP arithmetic & trigonometric
- Kernel is triply-nested loop over proteins, ligands, poses
 - Chapel follows CUDA decomposition: 1D kernel assigning multiple poses to thread

 requires transfer of protein, ligand, and pose data to GPU; energies to host (in Chapel, these are simple array assignments)

```
const protein = context.protein;
const ligand = context.ligand;
const forcefield = context.forcefield;
const poses: [0:int(32)..<6:int(32), 0..#nposes] real(32) = context.poses[{0..<6, gpuID*nposes..#nposes}];</pre>
```

TeaLeaf

- Collection of iterative sparse linear solvers, simulating heat conduction over time using five-point stencils over 2D grid
- Low arithmetic intensity = better suited to low STREAM balance
- 2D index domains: expose parallelism over both loops

```
Kokkos::parallel for(
#pragma omp target teams distribute parallel for simd
                                                                   x * y, KOKKOS_LAMBDA(const int &index) {
collapse(2)
                                                                     const int kk = index % x;
for (int jj = halo depth; jj < y - halo depth; ++jj) {</pre>
                                                                     const int jj = index / x;
  for (int kk = halo_depth; kk < x - halo_depth; ++kk) {</pre>
    const int index = kk + jj * x;
                                                                     if (kk >= halo depth
    p[index] = beta * p[index] + r[index];
                                                                      && kk < x - halo depth
                                                                      && jj >= halo depth && jj < y - halo depth) {
                                                                       p(index) = beta * p(index) + r(index);
                                                                   });
[(i,j) \text{ in Domain.expand}(-halo depth)] p[i,j] = beta * p[i,j] + r[i,j];
           https://github.com/milthorpe/TeaLeaf
```

S. McIntosh-Smith, et al., <u>Tealeaf: A mini-application to enable design-space explorations for iterative sparse linear solvers</u>. IEEE International Conference on Cluster Computing (CLUSTER), 2017.

TeaLeaf - Reductions

- Many sum reductions to compute global deltas or error metrics
 - In Chapel 2.0, these must be computed in global memory

```
var temp: [reduced_local_domain] real = noinit;
Kokkos::parallel reduce(
   x * y,
   KOKKOS_LAMBDA(const int &index, double &rrn_temp) { forall oneDIdx in reduced OneD {
      const int kk = index % x;
                                                          const ij = reduced local domain.orderToIndex(oneDIdx);
      const int jj = index / x;
                                                          u[ij] += alpha * p[ij];
     if (kk >= halo depth
                                                          r[ij] -= alpha * w[ij];
                                                                                      Chapel 2.0
      && kk < x - halo depth
                                                          temp[ij] = r[ij] ** 2;
      && jj >= halo depth
      && jj < y - halo depth) {
                                                        rrn = gpuSumReduce(temp);
       u(index) += alpha * p(index);
        r(index) -= alpha * w(index);
                                                        var rrn: real;
        rrn temp += r(index) * r(index);
                                                        forall ij in reduced local domain
                                                          with (+ reduce rrn) {
    },
                                                          u[ij] += alpha * p[ij];
    *rrn);
                                                          r[ij] -= alpha * w[ij];
                                                                                      Chapel 2.x
                                                          rrn += r[ij] ** 2;
```

TeaLeaf – Chapel Multi-Dimensional Indexing

- Using 2D indices improved readability of Chapel code and performed well on CPU platforms
- However, using 2D domains reduced GPU performance due to underutilization of available GPU cores in Chapel 2.0
 - first dimension is assigned to GPU threads
 - remaining dimensions implemented as loops inside GPU kernel
- We replaced multi-dimensional loops with 1D loop over linearized space to allow full utilization of GPU cores

```
const Domain = {0..<y, 0..<x};
forall ij in Domain {
    u[ij] = energy[ij] * density[ij];
}

const Domain = {0..<y, 0..<x};
const OneD = {0..<y*x};
foreach oneDIdx in OneD {
    const ij = local_domain.orderToIndex(oneDIdx);
    u[ij] = energy[ij] * density[ij];
}</pre>
```

Conclusions

- \bullet Pennycook, Sewall and Lee's metric \P remains a useful lens for evaluating portable programming models and identifying areas of strength and weakness
- Performance portability of OpenMP and Kokkos continues to improve
- Chapel compares favourably for performance-portable parallel programming
 - concise code
 - (mostly) good performance across a wide range of platforms
 - easier path to multi-device, multi-node distribution
- Some issues remain with Chapel GPU code generation
 - fixing these will avoid performance pitfalls for users

Acknowledgments

- This research used resources of the Experimental Computing Laboratory (ExCL) and the Oak Ridge Leadership Computing Facility at Oak Ridge National Laboratory, which are supported by the Office of Science of the U.S. Department of Energy under Contract No. DE-AC05-00OR22725, and resources of the National Computational Infrastructure (NCI), which is supported by the Australian Government.
- This research was funded, in part, by the Brisbane Advanced Programming Systems Project.
- Thanks to Engin Kayraklioglu, Brad Chamberlain, Michael Ferguson, and Jade Abraham from the HPE Chapel team for helpful discussions during our development of the mini-applications in Chapel.
